Docket No.: 30952/41851

1. (Currently Amended) A method for providing reliable transmission Quality

of Service (QoS) in a communication network, the method comprising:

A. a local bearer network resource manager sending an establish connection

request to a peer bearer network resource manager for requesting to create a QoS

connection between the local bearer network resource manager and the peer bearer

network resource manager;

B. the local bearer network resource manager receiving an establish

connection response from the peer bearer network resource manager so as to

create the QoS connection; [[and]]

C. the local bearer network resource manager periodically sending a

handshake message to the peer bearer network resource manager, and determining

a connection status according to a handshake response returned by the peer bearer

network resource manager; and

[[C.]] D. the local bearer network resource manager transmitting QoS

information to the peer bearer network resource manager through the QoS

connection, wherein the QoS information is provided to connection nodes connected

to the local bearer network resource manager and the peer bearer network resource

manager respectively for providing corresponding resource[[.]];

wherein C comprises,

Application No. 10/566,739 Docket No.: 30952/41851 Amendment dated June 30, 2009

Reply to Final Official Action of April 1, 2009

C1. creating a local Keep Active (KA) timer at the local bearer network

resource manager, and creating a peer Keep Active (KA) timer at the peer bearer

network resource manager,

C2. when the local KA timer is timed out, the local bearer network resource

manager adding 1 to timeout times of the local KA timer and sending a further

handshake message to the peer bearer network resource manager,

C3. after receiving the further handshake message, the peer bearer network

resource manager restarting the peer KA timer and returning a handshake response

to the local bearer network resource manager, and

C4. the local bearer network resource manager determining the connection

status according to the timeout times of the local KA timer, the peer bearer network

resource manager determining the connection status according to whether the peer

KA timer is timed out.

2. (Previously presented) The method according to claim 1, wherein the local

bearer network resource manager and the peer bearer network resource manager

are located in a bearer control layer of a multiservice network.

3. (Canceled)

4. (Previously presented) The method according to claim 1, further

comprising:

the peer bearer network resource manager judging whether an identity of the local bearer network resource manager is valid, and if valid, sending the establish connection response to the local bearer network resource manager.

5. (Previously presented) The method according to claim 1, wherein information carried in the establish connection request comprises identification information and authentication information of the local bearer network resource manager initiating the establish connection request.

6. - 7. (Canceled)

8. (Currently Amended) The method according to claim [[6]] 1, wherein information carried in the handshake message comprises connection ID information and connection resource state information.

9. (Canceled)

10. (Previously presented) The method according to claim 1, further comprising:

the peer bearer network resource manager managing and controlling resources of the connection nodes connected to the peer bearer network resource manager according to the received QoS information.

Application No. 10/566,739 Amendment dated June 30, 2009

Reply to Final Official Action of April 1, 2009

11. (Previously presented) The method according to claim 1, further

comprising:

the local bearer network resource manager sending a QoS resource control

Docket No.: 30952/41851

message that carries the QoS information to the peer bearer network resource

manager.

12. (Previously presented) The method according to claim 11, wherein the

QoS resource control message comprises QoS resource request information, which

comprises connection identification, stream information, QoS parameters or a stream

descriptor.

13. (Previously presented) The method according to claim 11, wherein the

QoS resource control message comprises a QoS resource release request, which

comprises a connection identifier or a reason code.

14. (Previously presented) The method according to claim 11, wherein the

QoS resource control message comprises a QoS resource modify request, which

comprises a connection identifier and modified parameter information corresponding

to the QoS connection.

15. (Previously presented) The method according to claim 11, wherein the

QoS resource control message comprises a connection status inquiry message, the

method further comprises:

Docket No.: 30952/41851

the peer bearer network resource manager sending a QoS resource control policy to the connection nodes, which is connected to the peer bearer network resource manager according to the QoS resource control message;

the peer bearer network resource manager receiving a response of the QoS resource control policy from the connection nodes connected to the peer bearer network resource manager;

the peer bearer network resource manager checking resource consistency of the QoS connection; and

the peer bearer network resource manager returning a response of the connection status inquiry message to the local bearer network resource manager.

16. (Previously presented) The method according to claim 15, wherein the information carried in the response of the connection status inquiry message includes any one or more of the following: a connection identifier, stream information, QoS parameters, a stream descriptor, a label stack, a path maximum transmission unit, and a bearer network resource manager stack.

17.-19. (Canceled)

20. (Previously presented) The method according to claim 1, wherein the local bearer network resource manager and the peer bearer network resource manager are a bandwidth broker, a call agent, or a connection manager.

21. (Currently amended) A communication network comprising:

a first bearer network resource manager; and

a second bearer network resource manager in communication with the first

bearer network resource manager;

wherein the first bearer network resource manager is configured to [[:]],

send an establish connection request to the second bearer network

resource manager for requesting to create a QoS connection between the first

bearer network resource manager and the second bearer network resource

manager[[;]],

receive an establish connection response from the second bearer

network resource manager so as to create the QoS connection[[;]], [[and]]

transmit QoS information through the QoS connection to the second

bearer network resource manager[[;]], and

create a first Keep Active (KA) timer, add 1 to timeout times of the first

KA timer and send a further handshake message to the second bearer network

resource manager when the first KA timer is timed out, and to determine a

connection status according to the timeout times of the first KA timer.

wherein the second bearer network resource manager is configured to.

create a second Keep Active (KA) timer,

restart the second KA timer and return a handshake response to the

first bearer network resource manager after receiving the further handshake

message, and to determine a connection status according to whether the second KA

timer is timed out,

Docket No.: 30952/41851

network resource manager are configured to control and manage resources

and wherein the first bearer network resource manager and the second bearer

according to the QoS information.

22. (Previously presented) The communication network according to claim 21,

wherein the first bearer network resource manager is further configured to

periodically send a handshake message to the second bearer network resource

manager, and to determine a connection status according to a handshake response

returned by the second bearer network resource manager.

23. (Previously presented) The communication network according to claim 21,

wherein the second bearer network resource manager is configured to judge

whether an identity of the first bearer network resource manager is valid, and if valid,

send the establish connection response to the first bearer network resource

manager.

24. (Canceled)

25. (Currently amended) A method implemented by a bearer network resource

manager in a bearer network, the method comprising:

sending an establish connection request for requesting to create a QoS

connection to a peer bearer network resource manager;

receiving an establish connection response from the peer bearer network resource manager so as to create the QoS connection;

transmitting QoS information through the QoS connection to the peer bearer network resource manager; [[and]]

controlling and managing a resource in the bearer network according to the QoS information[[.]];

creating a local Keep Active (KA) timer;

adding 1 to timeout times of the local KA timer when the local KA timer is timed out;

sending a further handshake message to the peer bearer network resource manager; and

determining a connection status according to the timeout times of the local KA timer.

26. (Previously presented) The method according to claim 25, further comprising:

periodically sending a handshake message to the peer bearer network resource manager; and

determining a connection status according to a handshake response returned by the peer bearer network resource manager.

27. (Canceled)
